Formulas & Laws by topic

Nov. 2024 Edition

## EXPONENTIAL

$$f(x) = \pm ab^{(x-h)} + k$$

Translations:

|       |                                |
|-------|--------------------------------|
| $h$   | + shifts left, - shifts right  |
| $k$   | + shifts up, - shifts down     |
| $a$   | $a >$ stretches, $a <$ shrinks |
| $\pm$ | reflects over $x$ -axis        |

## FUNCTIONS

**Functions** can be one-to-one or many-to-one

**Relations** are one-to-many

Many-to-one  $\therefore$   
Is a **function**

One-to-many  $\therefore$   
Is a **relation**

**Domain:**

All valid  $x$  outputs

**Range:**

All valid  $y$  outputs

Notations:

Interval Notation

$$a \leq x < b$$

Set Notation

$$\{x | a \leq x < b\}$$

Number Line

Reciprocal Functions:

$$\text{For } f(x) = \frac{b}{cx+d} + a \text{ where } b, c \neq 0$$

$$\text{Asymptotes: } x = -\frac{d}{c} \text{ and } y = \frac{a}{c}$$

## REFERENCE

$$\pi : 3.1415926535$$

$$e : 2.7182818284$$

$\mathbb{R}$  : Real Numbers

## QUADRATICS

$$x = \frac{-b \pm \sqrt{\Delta}}{2a}$$

$$\Delta = b^2 - 4ac$$

$\Delta > 0$  gives you an upwards curve (w/ minimum)

$\Delta = 0$  gives you a straight line

$\Delta < 0$  gives you a downwards curve (w/ maximum)

Function Forms:

|                       |                               |
|-----------------------|-------------------------------|
| $ax^2 + bx + c$       | Standard                      |
| $a(x + r_1)(x + r_2)$ | Factored $r$ being roots      |
| $a(x - h)^2 + k$      | Vertex $(h, k)$ is the vertex |

$$h = \frac{-b}{2a}$$

To find  $k$ , just replace  
 $x$  with 0

## LOGS

|              |   |
|--------------|---|
| Addition     | $\log_a m + \log_a n = \log_a mn$                       |
| Substraction | $\log_a m - \log_a n = \log_a \left(\frac{m}{n}\right)$ |
| Powers       | $\log_a m^k = k \cdot \log_a m$                         |
| Base Change  | $\log_a m = \frac{\log_b m}{\log_b a}$                  |

Rules:

$$\log_a 1 = 0$$

$$\log_a a = 1$$

$$a^{\log_a x} = x$$

$$\log_e x = \ln x$$
